**Current Perspectives in Chemical Science**

**21<sup>st</sup> November 2021**

**Objectives:**

Click chemistry refers to a group of reactions that are fast, simple to use, easy to purify, versatile, regiospecific, and give high product yields. While there are a number of reactions that fulfill the criteria, the Huisgen 1,3-dipolar cycloaddition of azides and terminal alkynes has emerged as the frontrunner. It has found applications in a wide variety of research areas, including materials sciences, polymer chemistry and pharmaceutical sciences... Radiopharmaceuticals are radioisotopes bound to biological molecules able to target specific organs, tissues or cells within the human body. These radioactive drugs can be used for the diagnosis and, increasingly, for the therapy of diseases.

## Historical Background of Polymer

**Charles Goodyear**

Father of Vulcanization Process (1844)

➤ **POLYMER:**  
POLY means **MANY** and MER means **UNIT** i.e. many units.

➤ Polymers are macromolecules formed by joining of repeating units on a large scale.

➤ Polymer which is composed from small subunits called **Monomer**.

➤ The process by which the monomer molecules are linked to form polymer is called **Polymerization**.

# Click Reaction

Click chemistry is a simple name for a simple set of reactions

The core of the click chemistry concept is the cultivation of a small set of reactions that are extremely ideal for working with organic molecules. Sharpless described them in his famous 2001 paper:

- A 'CLICK REACTION' would :
- be modular
  - be wide in scope
  - give very high yields
  - generate only inoffensive byproducts (easily removed)
  - be stereospecific (not necessarily enantioselective)
  - required simple reaction conditions
  - required readily available reagents and starting material
  - required no or benign solvent or easily removable solvent
  - required simple product isolation and purification (no Flash)
  - gives product that are stable in physiological conditions
  - be atom economic
  - have a high thermodynamic driving force (more than 20 kcal mol<sup>-1</sup>)

## mIDH1/2 in Glioma

- Occur early in the gliomagenesis
- Mutation involves a substitution of arginine-132 with histidine (R132H)
- Change the function of the enzymes in Gliomas Activates oncogenesis
- Inactivate tumor suppression genes
- Cause enzyme to produce high D-2- hydroxyglutarate
- Drive increased methylation in gliomas
- Inhibits lysine histone demethylases
- Leads to a hypermethylated state of DNA
- Drug targeting mIDH remains an area of active research

## Polymerization Method: Chain-Growth Polymerization

✓ Radical Polymerization: Free-radical polymerization (FRP) is a method of polymerization, by which a polymer forms by the successive addition of free-radical building blocks.

✓ Ionic Polymerization is a chain-growth polymerization in which active centers are ions or ion pairs. It can be considered as an alternative to radical polymerization, and may refer to anionic polymerization or cationic polymerization.
